

### ASX ANNOUNCEMENT

Date: 9 November 2015

Number: 442/091115

### RED HILL CONTINUES TO DELIVER

#### Drill Hole RHD015 returns:

**3.9 metres at 4.2 g/t platinum, 3.8 g/t palladium and 0.3 g/t gold (8.3 g/t Pt+Pd+Au)  
1.4% copper, 0.3% nickel and 19 g/t silver**

including

**0.5 metres at 14.2 g/t platinum, 6.2 g/t palladium and 0.2 g/t gold (20.6 g/t Pt+Pd+Au)  
5.2% copper, 0.7% nickel and 50 g/t silver**

#### Drill Hole RHD017 returns:

**16 metres at 1.4 g/t platinum, 1.4 g/t palladium, 0.1 g/t gold (2.9 g/t Pt+Pd+Au)  
0.3% copper, 0.3% nickel, 9 g/t silver**

including

**1.7 metres at 3.6 g/t platinum, 3.9 g/t palladium, 0.2 g/t gold (7.7 g/t Pt+Pd+Au)  
0.6% copper, 0.4% nickel and 20 g/t silver**

#### Drill Hole RHD016 returns:

**0.3 metres at 4.2% copper, 114 g/t (3 ounces) silver, 0.2 g/t gold, 0.1% zinc and  
0.1% lead within 17 metre thick zone of anomalous base metals**

**Drill Hole RHD018 in Broken Hill sequence rocks intersects  
two, one metre thick units of high-grade zinc sulphide**

**High grade zinc sulphide (sphalerite – bronze metallic coloured mineral)**

Further high grade platinum group metal (PGM), copper and nickel mineralisation and now for the first time, high grade zinc mineralisation have been returned from Impact Minerals Limited's (ASX:IPT) Red Hill Prospect, part of the Broken Hill Project in New South Wales.

Assays from three further drill holes near the old mine workings at Red Hill confirm that good to high grades of PGM-copper-nickel mineralisation are present over robust widths within 50 m of surface in 10 out of the 11 drill holes completed thus far (9 drill holes assayed, with assays pending from one hole (RHD019) with visually encouraging copper-nickel mineralisation).

**Drill hole RHD015** tested the eastern part of the ultramafic unit at Red Hill and underlying metasedimentary rocks (Figure 1, Table 1). The hole returned:

**3.9 metres at 4.2 g/t platinum, 3.8 g/t palladium and 0.3 g/t gold (8.3 g/t Pt+Pd+Au), 1.4% copper and 0.3% nickel from 58.1 metres down hole; including 0.5 metres at 14.2 g/t platinum, 6.2 g/t palladium and 0.2 g/t gold (20.6 g/t Pt+Pd+Au), 5.2% copper and 0.7% nickel and 50 g/t (1.6 ounces) silver from 60.1 metres down hole.**

**Figure 1.** Geology and drill hole locations at Red Hill showing the six significant assays of the current drill programme in holes RHD008, 012, 014, 015, 016 and 017. Assays are awaited for Hole 019.

**Drill hole RHD017** was designed to test a small conductor identified in a down hole EM survey in Hole RHD012 that returned extremely high grade PGM-copper-nickel-silver mineralisation (see announcement dated [23 October 2015](#)). Although no explanation for the conductor was found, the hole intersected a zone of mineralisation that returned:

**16 metres at 1.4 g/t platinum, 1.4 g/t palladium, 0.1 g/t gold (2.9 Pt+Pd+Au)  
0.3% copper, 0.3% nickel and 8.7 g/t silver from 39 metres down hole; including**

**1.7 metres at 3.6 g/t platinum, 3.9 g/t palladium, 0.2 g/t gold (7.7 g/t Pt+Pd+Au)  
0.6% copper, 0.4% nickel and 20 g/t silver from 41.9 metres down hole; and also including**

**0.6 metres at 3.2 g/t platinum, 3.9 g/t palladium, 0.1 g/t gold (7.3 g/t Pt+Pd+Au)  
1.7% copper, 0.8% nickel and 80 g/t (2.6 ounces) silver from 43.6 metres down hole.**

The mineralisation in both RHD015 and 017 is associated with a single ultramafic dyke within the metasedimentary rocks.

**Drill hole RHD016** was also drilled to test the eastern part of the ultramafic unit and underlying metasedimentary rocks. The hole intersected a 17 metre thick zone of variably anomalous base and precious metals within metasedimentary rocks. Ultramafic rocks were not intersected.

The best intercept came from a narrow vein with visible copper sulphide that returned:

**0.3 metres at 4.2% copper, 114 g/t (3 ounces) silver, 0.2 g/t gold,  
0.1% zinc and 0.1% lead from 44.4 metres down hole.**

The style and significance of this mineralisation in RHD016 is uncertain and detailed core logging is in progress. However, the mineralisation may be in part related to Broken Hill-style mineralisation. If this is the case, then zones where such mineralisation are cross-cut by the ultramafic dykes may be good targets for high grade PGM-copper-nickel mineralisation.

**Drill hole RHD019** was completed on Sunday and was also designed to test the modest EM conductor identified in Hole RHD012 at about 45 metres below surface. No explanation for the conductor was found. However a zone of very anomalous weathered copper-nickel mineralisation up to 4 metres thick was intersected at about 40 metres down hole. Detailed core logging is in progress.

Hole RHD019 has been drilled to the west to a depth of 150 metres in order to facilitate a further down hole EM survey. This survey will be used to help refine the position of a possible new conductor potentially identified at depth below Hole RHD017 and also possibly below Hole RHD012. This is encouraging for helping direct further drill holes.

The survey is due to start within the next 7 to 10 days as a survey crew becomes available.

Drilling has now ceased at Red Hill pending receipt of the results of the assays and down hole EM survey for RHD019 and the detailed interpretation of the geology from the core logging.

Further drilling will commence as soon as practicable. However, new statutory environmental approvals will be required in places and it is not known how long these may take to be issued.

**Figure 2.** Geology and drill hole locations in the greater Red Hill area showing the location of Hole RHD018 with high grade zinc and also the significant lower grade results from Hole RHD009. Note that the intercepts for Holes RHD009 and 007 are projected to surface and the mineralisation occurs predominantly at the base of, or below, the ultramafic intrusion.

### High Grade Zinc Sulphides at Target T2

Hole RHD018 was drilled to test a moderate EM conductor down dip of rocks that contain weathered Broken Hill style alteration, so called “Lode Rocks”, and patchy zinc-lead-silver-copper mineralisation (Target T2, Figure 2).

The EM conductor was modelled to be at a depth of between 120 m and 140 metres down hole. The hole intersected weak to moderate disseminated and vein iron sulphides with lesser copper, zinc and lead sulphides over this interval. However, it is interpreted that this is in insufficient quantities to explain the EM conductor.

The hole also intersected two separate one metre intervals of high grade zinc sulphides at 149 metres and about 153 metres down hole (see photo on front page).

This is the first intercept of high grade Broken Hill-style mineralisation by Impact Minerals. It lies in similar rocks to those that host the thick lower grade mineralisation reported in Hole RHD009 (see announcement dated [2<sup>nd</sup> November 2015](#)) and found close to the Red Hill intrusion (Figure 2).

The mineralisation is about 300 metres along strike to the east from the Dora Prospect owned by Perilya Limited.

The prospectivity of the Red Hill area for zinc-lead-silver mineralisation will be assessed following completion of the current drill programme.

### **About the PGM mineralisation at Red Hill**

PGM-copper-nickel mineralisation, including the rare PGM's rhodium, iridium, osmium and ruthenium has now been found from surface to a depth of 50 metres over 50 metres of trend and which is open in several directions (Figures 1 and 3).

The width of the mineralised zones has yet to be established however Hole RHD019 has established that the strike of one of the main ultramafic units is NE. Thus the true widths of the mineralised intercepts are likely to be thinner than quoted.

Detailed logging of the diamond drill core is in progress. Significant structural and lithological (rock type) controls on the high-grade PGM-copper-nickel mineralisation have been identified, in particular in Hole RHD012 (see announcement dated [23 October 2015](#)) that returned (Figure 3):

**3.5 metres at 159 g/t (5.3 ounces) 6PGE+gold 2.9% nickel, 2.3% copper and  
14.5 g/t silver from 67.3m down hole (50 m below surface)**

**where the 6PGE+gold equals**

**1.7 g/t rhodium, 2.6 g/t iridium, 2.0 g/t osmium and 1.1 g/t ruthenium  
5 g/t platinum, 6 g/t gold, 144 g/t (4.6 ounces) palladium.**

The mineralisation is related to dykes of ultramafic rock that have intruded along structures and veins that cross-cut metasedimentary rocks and pegmatites (coarse quartz-feldspar rocks). The fractures and veins that control the higher grade mineralisation are commonly better developed in the more competent pegmatites and detailed logging and mapping of these units is in progress.

**Figure 3.** Cross section through the Red Hill Prospect.

**About the Broken Hill Project (see also announcement dated [23<sup>rd</sup> October 2015](#))**

The Broken Hill Project comprises three exploration licences that cover a 40 km trend of rocks prospective for nickel-copper-PGE in mafic and ultramafic rocks and lead-zinc-silver in “Broken Hill-style” deposits hosted mostly by metasedimentary and related rocks.

Two of the licences are 100% owned by Impact.

Subject to Ministerial approval, expected within a few months, Impact will acquire the third licence, E7390 (via its 100% owned subsidiary Siouville Pty Limited), from Golden Cross Resources and this will entitle Impact to 100% of the nickel-copper-PGE rights, previously in joint venture with Golden Cross.

The consideration payable to Golden Cross upon Ministerial approval is \$60,000 cash and a 1% gross production royalty on all metals to which Impact and or Siouville has the rights for.

At its election Impact also has the right to buy back the royalty for \$1.5 million at anytime up to a Decision to Mine, or leave the royalty uncapped during any production.

In addition, upon the acquisition of E7390 Impact will also move to an 80-20 joint venture for Broken-Hill style mineralisation with Silver City Minerals Limited and free-carry Silver City's 20% interest to a Decision to Mine.

The consideration payable to Silver City is \$50,000 cash.

Squadron Resources Pty Limited has the right to invest \$1 million for a 19.9% interest in the nickel-copper-PGE rights under the terms of an investment into Impact as outlined in the announcement to the ASX dated [17 July 2015](#). However, Squadron is not liable for any payment of the royalty to Golden Cross.

Squadron Resources Pty Limited has no rights to earn into the lead-zinc-silver-other metals rights.

**Table 1. Significant Intercepts from Red Hill**

**Dr Michael G Jones**  
**Managing Director**

*The review of exploration activities and results contained in this report is based on information compiled by Dr Mike Jones, a Member of the Australian Institute of Geoscientists. He is a director of the company and works for Impact Minerals Limited. He has sufficient experience which is relevant to the style of mineralisation and types of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code). Mike Jones has consented to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

## APPENDIX 1 - SECTION 1 SAMPLING TECHNIQUES AND DATA

Criteria	JORC Code explanation	Commentary
Sampling techniques	<p><i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></p> <hr/> <p><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used</i></p> <hr/> <p><i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information</i></p>	<p><b>Rock Chip Samples</b> Random rock samples were taken at surface which represented favourable geology and alteration to known mineralisation in the region. Samples are variably weathered.</p> <p><b>Soil Samples</b> Soil samples were taken at 50 m intervals from a hole 15-20 deep and sieved to -2mm to collect about 250 g of material.</p> <p><b>Diamond Drilling</b> Diamond drilling was used to produce drill core either with a diameter of 63.5 mm (HQ) or 47.6 mm (NQ). A handheld XRF instrument was used to analyse the drill core at 50 cm intervals.</p> <hr/> <p><b>Rock Chip Samples</b> Representative rock chip samples at each sample site weigh between 0.8 and 1.2 kg. Soil samples are taken at a consistent depth below surface and sieved.</p> <p><b>Soil Samples and Drill Samples</b> Sample representivity was ensured by a combination of Company Procedures regarding quality control (QC) and quality assurance / testing (QA). Examples of QC include (but are not limited to), daily workplace and equipment inspections, as well as drilling and sampling procedures. Examples of QA include (but are not limited to) collection of "field duplicates", the use of certified standards and blank samples approximately every 50 samples.</p> <hr/> <p><b>Rock Chip and Diamond Drill Samples</b> Rock samples and split diamond core were sent to Intertek Adelaide where they were crushed, dried and pulverised (total prep) to produce a 25-30 g sub-sample for analysis by four acid digest with an ICP/AES finish for ore grade base metal samples and either lead collection or nickel sulphide fire assay with AAS or MS finish for gold and the PGMs. Weathered samples contained gossanous sulphide material. Soil samples were sent to SGS Perth for analysis by the MMI digest. The XRF data is qualitative only. A comparison between the XRF results and wet chemical assay data will be completed on receipt of final results.</p>
Drilling techniques	<p><i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></p>	<p>Diamond Drilling comprises NQ (47.6 mm diameter) and HQ (63.5 mm diameter) sized core. Impact diamond core is triple tube and is oriented. Historical diamond core was not oriented.</p>
Drill sample recovery	<p><i>Method of recording and assessing core and chip sample recoveries and results assessed</i></p>	<p>Diamond core recoveries for all holes are logged and recorded. Recoveries are estimated to be approximately &gt;97% for the Red Hill Prospect. No significant core loss or sample recovery problems are observed in the drill core.</p>

Criteria	JORC Code explanation	Commentary
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples</i>	Diamond core is reconstructed into continuous runs on an angle iron cradle for orientation marking. Depths are checked against the depth given on the core blocks and rod counts are routinely carried out by the driller.
	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	No sample bias has been established.
<b>Logging</b>	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	Geological logging of samples followed company and industry common practice. Qualitative logging of samples included (but not limited to); lithology, mineralogy, alteration, veining and weathering. Diamond core logging included additional fields such as structure and geotechnical parameters.  Magnetic Susceptibility measurements were taken for each 0.5 m diamond core interval.  For diamond core, information on structure type, dip, dip direction, texture, shape and fill material has been recorded in the logs. RQD data has been recorded on selected diamond holes. Handheld XRF analysis was completed at 50 cm intervals on diamond core.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	All logging is quantitative, based on visual field estimates. Systematic photography of the diamond core in the wet and dry form was completed.
	<i>The total length and percentage of the relevant intersections logged</i>	All diamond drill holes were logged in full.  Detailed diamond core logging, with digital capture was conducted for 100% of the core by Impact's on-site geologist.
<b>Sub-sampling techniques and sample preparation</b>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	All core samples were sampled by half core. Selected intervals of quarter core will be selected for check assays if required.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	No RC drilling results are reported.
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	Company procedures were followed to ensure sub-sampling adequacy and consistency. These included (but were not limited to) daily work place inspections of sampling equipment and practices, as well as sub-sample duplicates ("field duplicates").
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	Laboratory QC procedures for rock sample and diamond drill core assays involve the use of internal certified reference material as assay standards, along with blanks, duplicates and replicates.
	<i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i>	<b>Rock and Soil Samples</b> Field duplicates were taken at selected sample sites.

Criteria	JORC Code explanation	Commentary
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	<b>Diamond Core Samples</b> Quarter core duplicate samples are taken randomly every 50 samples. Sample sizes at Red Hill are considered adequate due to mineralisation style.
<b>Quality of assay data and laboratory tests</b>	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	An industry standard fire assay technique for samples using lead collection with an Atomic Absorption Spectrometry (AAS) finish was used for gold and aqua regia digest for base metals and silver.
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	No geophysical tools were used to determine material element concentrations. A handheld XRF was used for qualitative analysis only.
	<i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	<b>Rock Chip Samples</b> For the rock chips, quality control procedures for assays were followed via internal laboratory protocols. Accuracy and precision are within acceptable limits. <b>Diamond Drill Samples</b> Reference standards and blanks are routinely inserted into every batch of samples at a rate of 1 in every 50 samples.
<b>Verification of sampling and assaying</b>	<i>The verification of significant intersections by either independent or alternative company personnel.</i>	The results have not been verified by independent or alternative companies. This is not required at this stage of exploration.
	<i>The use of twinned holes.</i>	No drilling results are reported.
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	Primary assay data for rock chips has been entered into standard Excel templates for plotting in Mapinfo. All historical drill data has been entered digitally by previous explorers and verified internally by Impact.
	<i>Discuss any adjustment to assay data.</i>	There are no adjustments to the assay data.
<b>Location of data points</b>	<i>Accuracy and quality of surveys used to locate drillholes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	Sample locations and drill holes were located by hand held GPS.
	<i>Specification of the grid system used.</i>	The grid system for Broken Hill is MGA_GDA94, Zone 54.
	<i>Quality and adequacy of topographic control.</i>	Standard government topographic maps have been used for topographic validation. For the diamond holes, down-hole single shot surveys were conducted by the drilling contractor. Surveys were conducted at 15 m, 30 m and then approximately every 30 m down-hole.
<b>Data spacing and distribution</b>	<i>Data spacing for reporting of Exploration Results.</i>	Sample spacing for the soil survey was on a 50 m by 50 m grid. Reconnaissance drill spacing is approximately 200 m.
	<i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	Estimations of grade and tonnes have not yet been made.

Criteria	JORC Code explanation	Commentary
	<i>Whether sample compositing has been applied.</i>	Sample compositing has not been applied.
<b>Orientation of data in relation to geological structure</b>	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	Not relevant to soil and rock chip results. The orientation of mineralisation in RHD001 yet to be determined.
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	Not relevant to soil and rock chip results or early stage exploration drill results.
<b>Sample security</b>	<i>The measures taken to ensure sample security.</i>	Chain of custody is managed by Impact Minerals Ltd. Samples for Broken Hill are delivered by Impact Minerals Ltd by courier who transports them to the laboratory for prep and assay. Whilst in storage, they are kept in a locked yard. Tracking sheets have been set up to track the progress of batches of samples.
<b>Audits or reviews</b>	<i>The results of any audits or reviews of sampling techniques and data.</i>	At this stage of exploration a review of the sampling techniques and data by an external party is not warranted.

## SECTION 2 REPORTING OF EXPLORATION RESULTS

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	The Broken Hill Project currently comprises 1 exploration licences covering 100 km <sup>2</sup> . The tenement is held 100% by Golden Cross Resources Ltd. Impact Minerals Limited is earning 80% of the nickel-copper-PGE rights in the licence from Golden Cross. No aboriginal sites or places have been declared or recorded over the licence area. There are no national parks over the license area.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The tenement is in good standing with no known impediments.
<b>Exploration done by other parties</b>	Acknowledgment and appraisal of exploration by other parties.	There has been no significant previous work at this prospect.
<b>Geology</b>	Deposit type, geological setting and style of mineralisation.	Nickel-copper-PGE sulphide mineralisation associated with an ultramafic intrusion.

Criteria	JORC Code explanation	Commentary
<b>Drill hole Information</b>	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> <li>• easting and northing of the drill hole collar</li> <li>• elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>• dip and azimuth of the hole</li> <li>• down hole length and interception depth</li> <li>• hole length.</li> </ul>	See Table in text.
<b>Data aggregation methods</b>	<p>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</p> <p>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</p> <p>The assumptions used for any reporting of metal equivalent values should be clearly stated.</p>	<p>All reported assays have been length weighted. No top cuts have been applied. A cut-off of approximately 0.1% Cu, 0.4% Cu and 1.0% Cu has been applied for reporting of exploration results.</p> <p>High grade massive sulphide intervals internal to broader zones of disseminated sulphide mineralisation are reported as included intervals.</p> <p>No metal equivalents have been reported.</p>
<b>Relationship between mineralisation widths and intercept lengths</b>	<p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</p>	The orientation of mineralisation in RHD001 is yet to be determined.
<b>Diagrams</b>	<p>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</p>	Refer to Figures in body of text.
<b>Balanced reporting</b>	<p>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</p>	All results reported are representative

Criteria	JORC Code explanation	Commentary
<p><b>Other substantive exploration data</b></p>	<p>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</p>	<p>Assessment of other substantive exploration data is not yet complete however considered immaterial at this stage.</p>
<p><b>Further work</b></p>	<p>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive</p>	<p>Follow up work programmes will be subject to interpretation of results which is ongoing.</p>
