

Exploration impact at Silica Hill

NSW

JUNIOR explorer Impact Minerals has revealed high-grade silver hits at its Silica Hill prospect in NSW.

Assays from three drill holes have confirmed increasing grades at depth of high-grade gold and silver mineralisation.

Impact said the work to date indicated the prospect was very large and extended for at least half a kilometre down dip, with large areas still untested.

“The results are an exciting further breakthrough for us at Silica Hill as they indicate the mineralised system is getting better at depth and to the east,” *Impact managing director Dr Mike Jones* said.
