

# Clermont results due back soon

## Gold tests to give clearer answers

RESULTS of the second phase of bulk sampling at Impact Minerals Limited's Blackridge gold project near Clermont are expected to be available in the coming few weeks.

A total of 14 bulk samples were taken for about 160 tonnes in the second phase of bulk sampling, with panned concentrates from the samples sent for assay.

In a statement to the ASX, Impact said fine "overflow" material from the processing plant would also be assayed to determine the plant's ability to retrieve fine gold.

Three 1-tonne samples from the first phase of sampling that could not be processed because of a high clay content were also processed as part of the commissioning of the plant and these samples have been sent for assay.

"The second phase bulk samples are much larger than the 1-tonne samples taken in

the phase one sampling program," Impact said.

"This will help further quantify the 'nugget effect' and optimal sample size required at Blackridge, critical factors in exploration and resource definition for this style of deposit.

"Impact has shown that the nugget effect was an important factor in previous exploration drilling at Blackridge leading to a probable underestimation of grade."

The WA-based prospecting company has recently completed the sale of all its shares in Pacton Gold, a Canadian junior exploration company that currently controls the third largest gold property portfolio.

Impact received a total of \$763,000 in cash and shares for the sale.
